

1. **Sequence** - Carrying out instructions in order.
2. **Selection** - Making decisions using conditions such as if else statements.
3. **Repetition** - Repeating instructions with loops until task is completed.

The Structured Programming Theorem is important because it showed that complex programs can be built from a few simple ideas. Modern programming languages use these concepts to help developers create reliable and organized software.

### 3 Definitions of a Computer:

- A programmable electronic device that can store, retrieve, and process data.
- A device that accepts data, performs processing operations on that data, and supplies the results of these operations.
- An electrical device operating under the control of instructions stored in it own memory that can accept data, process it, produce information, and store it for future use.
